Place potatoe on pump handle to activate.

😊

Thanks
In Summary

- There are many parts to a UST system and therefore many things that can go wrong
- Being a good operator/inspector is being a good detective and watching for clues
- Some what’s wrong this are obvious but many are not
- Failure of systems can be due to installation error, physical and mechanical damage, ignoring alarms and warning signals, poor management oversight, general wear and tear, weather, and customers not paying attention
- Your mission is to not have your UST site end up in my slide shows
